

Business Requirement Document

Project title: High-Value Transaction Automation

Author: Sandeep Chinta

Client: Banking Client

Executive Summary:

The project addresses the challenges faced by banking client due to significant increase in the volume of high value transactions post covid-19. The existing manual process managed by the operations team, could not handle the increased load, leading to SLA breaches, customer refunds, and reputational damage. This BRD outlines the proposed solution – automating the transaction interface between the online banking system and the legacy platform.

Business Objectives:

- Automate the high-value transaction flow to reduce manual intervention.
- Improved SLA compliance and reduce customer refund rates.
- Enable scalability and minimize human error in transaction processing.
- Enhance customer satisfaction by speeding up transaction execution

Background:

- Legacy System: Handles backend processing of high-value transactions.
- Online Platform: Allows customers to submit high-value transactions digitally.
- Current Flow: Operations team manually downloads and enters data from the online system
into the legacy system.
- Issue: Post Covid-19, transactions from 1000 to over 2500 annually. Manual entry could't scale, leading to delays, SLA failures, and rising refund costs.

Problem Statement:

Manual transaction entry is no longer sustainable. The operations team is overwhelmed, and the business is suffering from:

- Inability to meet processing SLAs
- High number of refunds
- Negative customer impact
- Operational inefficiency

Scope:

In Scope:

- Documenting AS-IS and TO-BE business processes.
- Autoating data flow from online system to legacy system.
- Error handling and audit trail logging.
- Testing support and business acceptance validation.

Out of Scope:

- Changes to legacy system core logic.
- Changes to customer-facing online portal UI.
- Non-high value transaction processes.

Stakeholders:

Role	Name/Team	Responsibility
Sponsor	Business Director	Approves project and funding.
Business Analyst	Sandeep Chinta	Requirements gathering and validation
Operations Team	Ops Manager	Provides AS-IS process input
Development Team	.NET Developers	Builds automation tool
Platform Engineering	API Integration Support	Online transaction data access
QA/Testing	QA Analyst	Validates solution meets needs

Assumptions:

- Existing APIs or data exports from online system are available.
- Legacy system has interfaces that can be accessed programmatically.
- Operations team will participate in UAT and provide feedback.
- No changes needed on customer front-end interface.

Constraints:

- Solution must be delivered within 6 weeks.
- Minimal downtime permitted during deployment.
- Legacy system cannot be modified extensively due to vendor limitations.

Requirements:

Functional Requirements:

ID	Requirement Description
FR1	System shall fetch high-value transaction data from the online platform

FR2	System shall validate transaction data for completeness and accuracy
FR3	System shall automatically insert valid transactions into legacy system.
FR4	System shall log all transactions processed (success/failure)
FR5	Users shall be notified of any failed transactions.

Non-Functional Requirements:

ID	Requirement Description
NFR1	System should process transactions within 30 seconds
NFR2	System should be available 99.9% of the time.
NFR3	Data handling must comply with internal security and privacy policies
NFR4	Logs should be retained for a minimum of 90 days

AS-IS PROCESS DIAGRAM:

TO-BE PROCESS DIAGRAM:

Business Rules:

- Only transactions above a certain threshold (e.g: £10,000) are considered “high-value.”
- Transactions must include mandatory fields (customer ID, amount, date, transaction type).
- Duplicate transaction entries must be flagged and blocked.

Success Metrics:

Metric	Target
SLA Compliance	>95%
Transaction Processing Time	< 30 seconds
Refund Volume Reduction	>90%
Manual Touchpoints	Reduced to zero

Impact Analysis:

Area Affected	Impact
Opeartions Team	Reduced workload, increased efficiency
Customer Experience	Faster transactions, fewer errors
IT Infrastructure	Need for automation hosting and monitoring
Business Risk	Reduced due to improved SLA adherence

Dependencies:

- Avaiaibility of online system APIs/data feeds
- Access credentials for legacy system
- Final sign-off from business stakeholders
- Development resources availability

Timeline (High-Level):

Phase	Duration
Requirement Gathering	1 week
Design & Review	1 week
Development	2 weeks
Testing &UAT	1 week
Deployment & Handover	1 week

Risks & Mitigation:

Risk	Mitigation Strategy
API availabilty from online system	Early engagement with Platform Team
Legacy system errors	Conduct interface testing thoroughly
Ops team resistance	Conduct training and get buy-in early
Timeline slippage	Weekly check-ins and agile feedback loop

Appendices:

- Interview notes with stakeholders
- SLA and refund data (before automation)
- Access details for environments
- Glossary of Terms
